

Agar.io cheat sheet

General

Move the mouse	Cell moves at the position of the cursor
W	Eject mass
Space	Split your cell in two or more equal cells
Wheel up and wheel down	Zoom in / out

Tips

When you're split into two smaller cells with Space key, one cell will remain where the splitting cell was, and the other will project forward in the direction of the cursor.

Ejecting mass can be used to feed viruses, allied cells or feeding yourself if you are split into multiple cells. Only 87.5% of the mass lost is ejected.
