LibreOffice Basic IDE cheat sheet

General

F5	Run code starting from the first line, or from the current breakpoint, if the program stopped there before
Shift + F5	Stop
F7	Add watch for the variable at the cursor
F8	Single step through each statement, starting at the first line or at that statement where the program execution stopped before.
Shift + F8	Single step as with F8, but a function call is considered to be only one statement
F9	Set or remove a breakpoint at the current line or all breakpoints in the current selection
Shift + F9	Enable/disable the breakpoint at the current line or all breakpoints in the current selection
Shift + Ctrl + Q	Stop a runing macro (this shortcut also works outside of the Basic IDE)

Note: If you are inside the Basic IDE and the macro halts at a breakpoint, Shift+Ctrl+Q stops execution of the macro, but you can recognize this only after the next F5, F8, or Shift+F8.
